A mathematical model for the evolution of the (still unspecified) quantity a_n could take the form $a_{n+1} = \alpha a_n + \beta$ In words, the new value is a scalar multiple of the old value a_n set by some constant β . This model is common, e.g., it is used for modeling bank loans. One might amend the model to make the dependence depend on more terms and to include

MATHEMATICAL MODELING A Comprehensive Introduction

1 Introduction 1.1 What is mathematical modelling? Models describe our beliefs about how the world functions. In mathematical modelling, we translate those beliefs into the language of mathematics. This has many advantages 1. Mathematics is a very precise language. This helps us to formulate ideas and

identify underlying assumptions. 2.

An Introduction to Mathematical Modelling

A mathematical model is a mathematical relation that describes some real-life situation. Mathematical models are used to solve many real-life situations like: • launching a satellite. • predicting the arrival of the monsoon. • controlling pollution due to vehicles. • reducing traffic jams in big cities.
