Choke Valves are regarded by most major companies in the oil industry as the single most important valve in the production process. This is mostly due to a choke valve's key role in controlling the varying pressure of a reservoir while also protecting downstream valves and the pipeline. In oil production, when a wellhead is first constructed, it is done so with respect to its current or ...

A choke valve is sometimes installed in the carburetor of internal combustion engines. Its purpose is to restrict the flow of air, thereby enriching the fuel-air mixture while starting the engine. Depending on engine design and application, the valve can be activated manually by the operator of the engine (via a lever or pull handle) or automatically by a temperature-sensitive mechanism called ...

General Description of Choke Valve Operation: The SPM® Choke Valve restricts the flow through the valve by reducing the flow area through the valve body to achieve a desired flow rate. 2" Choke Valves have a maximum orifice size of 1" while 3" Choke Valves have a maximum orifice size of 2". Adjustable Choke Valves use a stem and seat combination to control the flow rate. The desired ...

Erosion in choke valves operating either in top side or subsea field subjected to sandy severe service conditions are considered as problems in oil & gas industries. 1. Critical location of the choke valve is trim components subjected to higher pressure drop also experiences higher flow velocity causes erosion in choke valves. 2. Particulate erosion in mainly due to jet impingement of sand ...

As stated earlier, the upstream operating pressure of the valve is spec'd at 8600 kPa (although MAWP is 10000 psi). However, the current U/S pressure is 11000 kPa resulting in a valve that doesn't need to be opened as wide to get the same flow. Getting the same flow through a smaller area means one thing.....increase in velocity through the valve.
