## Of The The Cryptonephridial

Histology, branch of biology concerned with the composition and structure of plant and animal tissues in relation to their specialized functions. The terms histology and microscopic anatomy are sometimes used interchangeably, but a fine distinction can be drawn between the two studies. The fundamental aim of histology is to determine how tissues are organized at all structural levels, from cells and intercellular substances to organs.

### Histology - TeachMePhysiology - Making Physiology Simple

Generally, the term medical physiology applies to human beings. However, the science of physiology applies equally to all living things. Journal of Molecular Histology and Medical Physiology is under the process of accepting the articles from the experts in the field of Molecular Histology And Medical Physiology for the upcoming issue of the journal with considerable Publication Charges.

**ANATOMY AND HISTOLOGY OF THE DIGESTIVE SYSTEM.** The digestive system consists of the digestive tract, or gastro-intestinal (GI; gas-trō-in-tes-tin-ă l) tract, plus specific associated organs. Because the digestive tract is open at the mouth and anus, the inside of the tract is continuous with the outside environment, and food entering the digestive tract may contain not only useful nutrients but also indigestible components such as fiber, or harmful materials such as bacteria.

Histology of the Nose. The nasal mucous membrane consists of respiratory epithelium (regio respiratoria) and sensory epithelium with olfactory cells (regio olfactoria). The mucosa is well supplied with blood and has numerous mucus-producing goblet cells—effective heating and humidifying of the air can thereby be ensured.

the rest of the alimentary canal, but with adaptations to the mucosa and muscularis for the unique functions of this organ. In addition to the typical circular and longitudinal smooth muscle layers, the muscularis has an inner oblique smooth muscle layer (). As a result, in addition to moving food through the canal, the stomach can vigorously churn food, mechanically breaking it down into smaller particles.

### The Stomach · Anatomy and Physiology

The alimentary tract of the pike is described, relating its feeding habits to its intestinal gut histology. It is a carnivorous species having a short oesophagus, pouch-like stomach and a short intestine with two convolutions. Stratified epithelium with columnar cells and many goblet cells are present in the oesophagus, columnar epithelial ...

INTRODUCTION. The skin is the largest organ of the body, accounting for about 15% of the total adult body weight. It performs many vital functions, including protection against external physical, chemical, and biologic assailants, as well as prevention of excess water loss from the body and a role in thermoregulation.
